The **International Plant Protection Convention (IPPC)** is an **intergovernmental treaty** signed by 184 countries or contracting parties, whose goal is to protect the world's plant resources from **invasive pests** and to promote **safe trade** of agricultural products. The **Convention** adopts and promotes the application of **International Standards for Phytosanitary Measures (ISPMs)** as the main set of tools to achieve its goals, making it the sole global standard setting organization for plant health. Main Topics

Plant Health and Food Security

Food security, as defined by the United Nations' Committee on World Food Security, means that all people, at all times, have physical, social, and economic access to sufficient, safe, and nutritious food that meets their food preferences and dietary needs for an active and healthy life. **Plant health** is important for this goal.

Plant Health and Safe Trade

The trade of goods is the engine that keeps civilization going, while healthy plants lets us humans eat and breathe and stay healthy. The IPCC's mandate is to enable contracting parties to the IPCC (countries) to protect terrestrial and aquatic plant resources by **preventing the introduction and spread of pests.**

Plant Health and Environmental Protection

Without an environment to live we would need to be able to live on other planets for human kind to survive. We can't do that, yet, and even if we could, it would be nicer to stay on our home planet with healthy plants living in symbiosis with us and other animals. Taking care of plants is important to **protect the environment** we all live in.
