***Fusarium oxysporum* f.sp. *cubense* Tropical Race 4 (TR4)**

Fusarium (TR4) is a significant threat to banana and plantain production worldwide. Since eradication is not feasible once present in the soil, prevention is the best strategy to maintain its absence and delay its spread.

What can you do to protect against Fusarium TR4?

- Help to delay introduction into new territories through prevention measures and contingency planning.
- Immediate containment through appropriate biosecurity measures once detected.
- Ensure coordination among national and regional plant protection organizations, farmers and researchers.
